

Hollow Wall Fastener Tool Instructions

Always wear eye protection when using any tool.

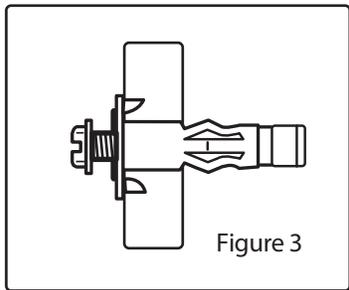

This tool is to be used with expansion type Hollow Wall Anchors only.

Step 1: Determine the thickness of the material into which you will be setting the anchor and select an anchor with the proper grip range for that thickness. See Figure 1.

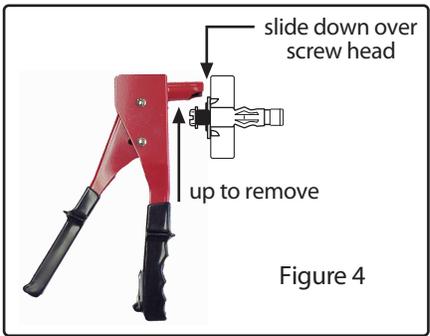

Step 2: Back the screw head out until the end of the screw is even with the end of the anchor. See Figure 2.

Step 3: Drill a hole in the wall the same diameter as the wall anchor. Insert the anchor into the hole so that the anchor's flange is flush against the wall. See Figure 3.

Step 4: Fully open the wall anchor tool handles and slip the nosepiece of the tool over the head of the anchor screw, as shown in Figure 4. Using both hands, firmly squeeze the tool's handles together until you feel the anchor collapse inside the wall. This will mean that the anchor is fully expanded and ready to use. Open the tool's handles and remove it from the anchor screw by pushing up, as shown in Figure 4.

Step 5: To mount bracket: Remove screw and place through the hole in bracket. Re-insert screw in anchor shell in wall and only tighten until all pieces come together snugly. Do not overrun.
