

Using the Bead Chain Splicing Tool

You will need to start with two ends of bead chain.

1. Insert one ball, at the end of the chain, into the slot on the front of the tool, so the pin enters the hole in the ball. Carefully squeeze the handles to spread the ball open so it can be removed; leaving the link at the end of chain.
2. Next place the ball, at the other end of chain, into the slot. Open the ball just enough to insert the link on the opposite end of the chain.
3. Next place the open ball into the cups, insert the link, and compress to close.
